

Manufacturer of pneumatic impact tools and hydraulic tools for mines, quarries, construction industry, steelworks and foundries.

## NEEDLE

## DRIVERS

### Dear client,

allow us to congratulate you on your purchase of the **NEEDLE DRIVER**, which will surely become your indispensable helper.

With your **NEEDLE DRIVER** you will very easily drive a needle-nail into almost all kinds of materials, such as concrete, brickwork, plaster, wall tiles, wood, metal sheet, aluminium, etc. Onto this needle, you may hang a picture, poster, photograph or other objects, always without causing any damage to the surface, and, above all, without hurting your fingers, because you will never need to use a hammer for this purpose any more!

### How to use the needle driver:

1. Insert the needle into the opening in the front part of the **DRIVER** (use a shorter needle for hard materials, and a longer one for soft materials).
2. Take the **DRIVERS** in your hand and place the needle at the point where you wish to drive it in. Place the **DRIVER** firmly against the wall. With your other hand, take hold of the rear head of the **DRIVER**, and by several movements forward and backward, without exerting any force, you will

succeed in driving the needle until it acquires a firm hold.

3. In case you want to attach a poster, photograph, drawing or another similar object, it is recommended to reinforce the material with the self-adhesive plastic sheet enclosed to the kit.
4. For reasons of safety, it is recommended to place a plastic cap on each needle. The caps are likewise enclosed to the kit.

### Notice

When driving the needles into concrete it may happen that the needle strikes a stone. In that case drive the needle in several millimeters from the original point.
